Guideline: Management of Anticoagulant Medications in the Periprocedural and Surgical Settings

Purpose of Guidelines:
Provide guidance to clinicians at Froedtert and The Medical College of Wisconsin for safely and effectively managing the use of anticoagulant medications during the periprocedural period. These guidelines are not intended to replace clinical judgment and may not apply to all patients. Periprocedural management of anticoagulant medications is a collaborative effort of the multidisciplinary healthcare team requiring analysis of individualized, patient specific factors. Given the challenges presented by patients requiring thromboembolic management undergoing surgical and other interventional procedures, strategies to optimally manage oral and parenteral anticoagulant medications were reviewed and are provided in this guideline.

Refer to the Department of Anesthesiology Preoperative Medication Management Guidelines for a more comprehensive list medications (including antiplatelets) and associated management in the perioperative setting.

Refer to table 2 for links to any surgical subspecialty specific guides that exist that can be used in combination or in place of this guideline based on the needs of the patient.

Background:
Parenteral and oral anticoagulants have become a standard of care for the treatment and prevention of venous thromboembolism (VTE) in certain surgical procedures (e.g., total hip and knee arthroplasty) and in the management of a variety of clinical disease states (e.g., atrial fibrillation, hereditary coagulopathies, systemic lupus erythematosus.1-7 The periprocedural management of patients receiving long-term anticoagulant therapy is a common and difficult clinical problem where the risk of bleeding must be carefully weighed against the risk of thromboembolism. Improper management of anticoagulants in the periprocedural setting can result in increased bleeding intra- and postoperatively. Alternatively, too little anticoagulation can lead to severe morbidity, including stroke and death.8

Clinical Assessment:
Thrombotic Risk and Bridging:
Patients on direct anticoagulant therapies (i.e. apixaban, dabigatran, edoxaban and rivaroxaban) do not require bridging due to the quick onset of action and short half-life of these medications.9

For patients on warfarin, the need for bridging in the periprocedural setting should be evaluated on a case-by-case basis.8 Bridging should be considered in patients at high risk for thrombosis and in some patients at moderate risk for thrombosis.

Stratification of high, intermediate, and low risk of thrombosis has been described by the American College of Chest Physicians and is summarized in Table 1.
**Atrial fibrillation:** Evidence from a randomized controlled trial recommends against bridging patients on warfarin for atrial fibrillation at low to moderate risk of thrombosis.\(^{23}\) Patient harm with increased bleeding rates were shown with bridging anticoagulation.\(^{23}\) Consensus guidelines suggest that a patient’s bleeding risk should also be considered to determine if bridging is used.\(^{24}\)

**Mechanical Heart Valves:** 2017 AHA/ACC Update of the 2014 AHA/ACC Guideline for Management of Patients with Valvular Heart Disease have downgraded the recommendation for bridging in patients with 1) mechanical AVR and any thromboembolic risk factor, 2) ball-cage or tilting disk mechanical AVR, or 3) mechanical MVR from a strong recommendation to a moderate recommendation.\(^{25}\) The risk of thrombosis must be outweighed by the risk of bleeding to consider bridging.

**VTE:** Retrospective studies of perioperative management of warfarin in patients with VTE have shown increased bleeding in patients who were bridged without a difference in thrombosis between patients treated with and without bridging.\(^{26}\) 79% of patients in the analysis were low-risk, 18% were moderate risk, and 3% were high risk. Based on retrospective data and extrapolation from randomized studies in atrial fibrillation, in patients with VTE at moderate risk of thrombosis, the harm associated with bridging needs to be outweighed by the thrombosis risk to consider bridging.

*Bleeding Risk and Resuming Anticoagulation Therapy:* Procedural bleeding risk determines how and when postprocedural anticoagulant therapy should be resumed.
- Procedures and their associated bleeding risk have also been identified and are described in Table 2

### Table 1. Thrombotic Risk Stratification for the Perioperative Period\(^{10,24}\)

<table>
<thead>
<tr>
<th>Thrombosis Risk Category</th>
<th>Mechanical Heart Valve</th>
<th>Atrial Fibrillation</th>
<th>Venous Thromboembolism</th>
</tr>
</thead>
</table>
| **High**                 | • Any mitral valve prosthesis  
• Any caged-ball or tilting disc aortic valve prosthesis  
• Recent (within 6 months) stroke or TIA | • CHADS\(_2\) Score 5-6;  
• CHA\(_2\)DS\(_2\)-VASc Score 7-9  
• Recent (within 3 months) stroke, TIA, or systemic embolism  
• Rheumatic valvular heart disease | • Recent (within 3 months) VTE  
• Severe thrombophilia (e.g., protein C, protein S or antithrombin deficiency; APLA, multiple abnormalities) |
| **Moderate**             | • Bileaflet aortic valve prosthesis and 1 or more of the following:  
o Atrial fibrillation  
o Prior stroke or TIA  
o Hypertension  
o Diabetes mellitus  
o Congestive heart failure  
o Age > 75 years old | • CHADS\(_2\) Score 3-4;  
• CHA\(_2\)DS\(_2\)-VASc Score 5-6  
• History of stroke, TIA or systemic embolism | • VTE within the past 3 to 12 months  
• Non-severe thrombophilia (e.g., heterozygous factor V Leiden or prothrombin gene mutation)  
• Recurrent VTE  
• Active cancer (treated within 6 months or palliative patients) |
| **Low**                  | • Bileaflet aortic valve prosthesis without AF and no other risk factors for stroke | • CHADS\(_2\) Score 0-2  
• CHA\(_2\)DS\(_2\)-VASc Score 0-4  
• No history of stroke, TIA or systemic embolism | • VTE events > 12 months previous and no other risk factors |

Abbreviations: AF = Atrial Fibrillation; APLA = Antiphospholipid Antibodies; CHADS\(_2\) = Congestive Heart Failure, Hypertension, Age > 75 years, Diabetes Mellitus, and Stroke or Transient Ischemic Attack; CHA\(_2\)DS\(_2\)-VASc = Congestive Heart Failure, Hypertension, Age > 75 years, Diabetes Mellitus, Stroke or Transient Ischemic Attack, Vascular Disease and Sex; TIA = Transient Ischemic Attack; VTE = Venous Thromboembolism
As a reminder, this guideline is not intended to replace clinical judgment and may not apply to all patients. Please **double-check with the proceduralist** regarding the risk of bleeding related to the procedure.

A procedure list has been created as part of the “2017 ACC Expert Consensus Decision Pathway for Periprocedural Management of Anticoagulation in Patients With Nonvalvular Atrial Fibrillation.” This is intended as reference material for discussion with providers related to risk categories.

### Table 2. Procedures and Associated Bleeding Risk

<table>
<thead>
<tr>
<th>Procedure</th>
<th>High Risk* of Major Bleeding (2-day risk of major bleeding 2 to 4%)</th>
<th>Low Risk of Major Bleeding (2-day risk of major bleeding 0 to 2%)</th>
<th>Low Bleeding Risk</th>
</tr>
</thead>
</table>
| **Cardiac**       | • Abdominal aortic aneurysm repair  
                   • Coronary artery bypass  
                   • Heart valve replacement                                                                                                    | • VAD removal  
                   • Pacemaker or defibrillator insertion, EP testing  
                   • Noncoronary angiography                                                                                                        | --                                                                               |

<td>Restart/continue warfarin</td>
<td>Continue warfarin +/- therapeutic LMWH (if bridging is being done)</td>
</tr>
</tbody>
</table>

### Procedure risk and need for bridging

**High Thrombosis Risk**

- Consider consult with proceduralist if you feel bridging therapy is warranted.
- Refer to the Thrombotic Risk Stratification for further guidance.

- Start bridging with therapeutic dose parenteral anticoagulant if indicated.
- Continue LMWH in patients being bridged.
- For once daily LMWH dosing, no dose given.
- For twice daily LMWH dosing, last dose is in the AM (omit PM dose).
- Last dose 24 hours prior to neuraxial anesthesia.

- Inpatient procedures: Collaboration with proceduralist is REQUIRED before restarting therapy.
- If bridging indicated:
  - **High Risk Bleeding Procedure:** Mechanical prophylaxis; Consider initiation of prophylactic LMWH 24 to 48 hours (day +1 or day +2) post-op.
  - **Low Risk Bleeding Procedure:** Resume therapeutic LMWH 24 hours post-op with PM dose.

**Moderate Thrombosis Risk**

- Consider consult with proceduralist if you feel bridging therapy is warranted.
- The risk of thrombosis must be outweighed by the risk of bleeding to consider bridging.

- Start bridging with therapeutic dose parenteral anticoagulant if indicated.
- Continue LMWH in patients being bridged.
- For once daily LMWH dosing, no dose given.
- For twice daily LMWH dosing, last dose is in the AM (omit PM dose).
- Last dose 24 hours prior to neuraxial anesthesia.

- Inpatient procedures: Collaboration with proceduralist is REQUIRED before restarting therapy.
- Outpatient procedures: Resume warfarin, unless specific instruction given by proceduralist for later restart date.
- If bridging indicated:
  - **High Risk Bleeding Procedure:** Mechanical prophylaxis; Consider initiation of prophylactic LMWH 24 to 48 hours (day +1 or day +2) post-op.
  - **Low Risk Bleeding Procedure:** Resume therapeutic LMWH 24 hours post-op with PM dose.

- Stop LMWH when INR is therapeutic.
Guideline: Management of Anticoagulant Medications in the Periprocedural and Surgical Settings

Note: All recommendations for bridging and restarting anticoagulation therapy do not account for regional anesthesia. LMWH does not need to be used for bridging therapy; UFH is an appropriate option.

Abbreviations: INR = International Normalized Ratio; LMWH = low molecular weight heparin (eg, enoxaparin); UFH = unfractionated heparin

* May consider continuing warfarin in patients undergoing a procedure with a low risk of bleeding

Back to Appendix Guide

**Dabigatran (Pradaxa)**

A. Tables 4 and 5 provide guidance for management of dabigatran in the perioperative and postoperative period for planned procedures

B. Note that patients on targeted anticoagulant therapies (i.e., apixaban, dabigatran, rivaroxaban and edoxaban) do not require bridging due to the relatively quick onset of action and short half-life of these medications

C. Holding dabigatran prior to a procedure is based on renal function and the risk of bleeding associated with the procedure

D. **Inpatient Procedures REQUIRE** approval by proceduralist is before restarting therapy

E. **Outpatient Procedures RECOMMEND** restarting post-operative day +1 or 2 based on risk as in table 4 and 5 (below) unless otherwise specified by proceduralist

Table 4. **High Bleeding Risk Procedures**: Perioperative and Postoperative Recommendations for Dabigatran²,¹⁴

Factor Xa Inhibitors: Rivaroxaban (Xarelto), Apixaban (Eliquis) and Edoxaban (Savaysa)

Tables 6 and 7 provide guidance for management of factor Xa inhibitors in the perioperative and postoperative period for planned procedures

A. Note that patients on targeted anticoagulant therapies (i.e., apixaban, dabigatran, rivaroxaban and edoxaban) usually do not require bridging due to the relatively quick onset of action and short half-life of these medications.
B. Holding factor Xa inhibitors prior to a procedure is based on renal function and the risk of bleeding associated with the procedure
C. **Inpatient Procedures REQUIRE** approval by proceduralist before restarting therapy
D. **Outpatient Procedures RECOMMEND** restarting post-operative day +1 or 2 based on risk as in table 6 and 7 (below) unless otherwise specified by proceduralist

Table 6. **High Bleeding Risk Procedures**: Perioperative and Postoperative Recommendations for Factor Xa Inhibitors

<th>Post-Operative Recommendation</th>
<th>Additional Considerations Dosing add</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Unfractionated Heparin (UFH)</strong></td>
<td>• <strong>Continuous IV infusion:</strong> Stop Infusion 4 to 6 hours prior to the procedure¹⁰</td>
<td>• Collaboration with proceduralist is REQUIRED before restarting therapy</td>
<td>• <strong>Continuous IV infusion:</strong> Restart IV infusion at the same infusion rate (if therapeutic) without a bolus¹⁰</td>
</tr>
<tr>
<td></td>
<td>• <strong>Intermittent, Subcutaneous Dosing (VTE Prophylaxis):</strong> No holding required for doses of 7,500 or less, can consider holding one dose prior to procedure in patients with high bleed risk procedures</td>
<td>• High risk bleeding surgical procedures: Re-initiate therapy 48 to 72 hours after the procedure¹⁰</td>
<td>• <strong>Intermittent, Subcutaneous Dosing:</strong> Start at the same dose prior to surgery.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Collaboration with proceduralist is REQUIRED before restarting therapy</strong></td>
<td>• Low risk bleeding risk surgical procedures: Re-initiate therapy 24 hours after the procedure¹⁰</td>
<td>• Refer to the Thrombotic Risk Stratification for the full classifications of low, moderate, and high thrombotic risk</td>
</tr>
<tr>
<td><strong>Enoxaparin (Lovenox)</strong></td>
<td>• <strong>Bridging Therapy Prior to the Procedure (BID Dosing):</strong> Administer the last dose 1 days (24 hours) prior to the procedure¹⁰</td>
<td>• <strong>Bridging Therapy Prior to the Procedure:</strong></td>
<td>• Restart patients at the same doses that were being used prior to the procedure</td>
</tr>
<tr>
<td></td>
<td>• <strong>Bridging Therapy Prior to the Procedure (Daily Dosing):</strong> Administer the last dose 2 days (36-48 hours) prior to the procedure</td>
<td><strong>High risk bleeding surgical procedures:</strong> Re-initiate therapy 48 to 72 hours after the procedure¹⁰</td>
<td>• Refer to the Thrombotic Risk Stratification for the full classifications of low, moderate, and high thrombotic risk</td>
</tr>
<tr>
<td></td>
<td>• <strong>General VTE Prophylaxis – Medical Patients:</strong> Last dose greater than 12 hours prior to procedure</td>
<td><strong>Low bleeding risk surgical procedures:</strong> Re-initiate therapy 24 hours after the procedure¹⁰</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Treatment of DVT with or without PE:</strong> Last dose 24 hours prior to procedure</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Unstable Angina (UA) and Non-Q-Wave MI:</strong> Last dose 1 day (24 hours) prior to procedure</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Acute ST-Segment Elevated MI:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Fibrinolytic therapy intervention:</strong> Administer between 15 minutes before and 30 minutes after the start of fibrinolytic therapy²</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>PCI intervention:</strong> Do not administer enoxaparin if patient has received a SC dose within the last 8 hours before balloon inflation. If the last enoxaparin SC dose was greater than 8 hours ago, administer a 0.3 mg/kg by IV bolus²</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Dalteparin (Fragmin)</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Prophylactic Dosing:</strong> Consider following the same recommendations above that are used for patients who are receiving bridging therapy before the procedure</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Fondaparinux (Arixtra)</strong></td>
<td>• Give the Last dose 3 days (72 hours) prior to procedure based on product half-life and in patients with a normal renal function</td>
<td>• Collaboration with proceduralist is REQUIRED before restarting therapy</td>
<td>• Fondaparinux is contraindicated in patients with a CrCl &lt; 30 mL/min and for VTE prophylaxis in patients weighing less than 50 kg who are undergoing hip fracture surgery, knee arthroplasty, or abdominal surgery⁵</td>
</tr>
<tr>
<td></td>
<td>• Patients with impaired renal function (CrCl 30-50 mL/min) may require holding therapy longer last dose 5-7 days before procedure</td>
<td>• VTE prophylaxis following hip fracture, hip replacement, knee arthroplasty, or abdominal surgery: initiate no sooner than 6 to 8 hours after surgery⁵</td>
<td>• Fondaparinux may be used for acute symptomatic DVT and PE in patients who weigh &lt; 50 kg⁵</td>
</tr>
<tr>
<td></td>
<td>• May consider an Anti-Xa level in patients where there is a concern of residual fondaparinux impacting coagulation (eg, obesity, renal dysfunction)</td>
<td>• Fondaparinux is contraindicated in patients with a CrCl &lt; 30 mL/min and for VTE prophylaxis in patients weighing less than 50 kg who are undergoing hip fracture surgery, knee arthroplasty, or abdominal surgery⁵</td>
<td>• Refer to the Thrombotic Risk Stratification for the full classifications of low, moderate, and high thrombotic risk</td>
</tr>
</tbody>
</table>
Note: All recommendations for bridging and restarting anticoagulation therapy do not account for regional anesthesia
